I am totally confused by copy and apply. The are the same even though they have different uses. I could figure out an example where using copy only saves two lines of code. Could anyone show me a more advanced example where applying is much better? thx A: Copy is one way to transform a thing into something else; apply is another way. If you need to do something to the result of a function, then copy it into the function and apply that function to it. If you need to do something to each member of a list, then first copy it to a new list, and then apply a function to each member. A: On the surface, you'd use them differently but in many cases it's useful to have them be the same. Take the following example. Say we have the following list: lst = {1, 2, 3, 4, 5} We can transform that to this: newLst = {#, #, #, #, #} & lst We can do this in three steps: Replace all the elements with the replacement value in the original list: Map[Replace[#, {#, #, #, #, #}, {0, 1}], lst] This gives us {0, 1, 0
